

kublr

Kubernetes for the enterprise

Accelerate and control the deployment, scaling, monitoring and management of your containerized applications

Kublr's enterprise-grade, open platform is built on a plug-gable architecture that integrates with your existing systems. Kublr delivers the reliability and flexibility large organizations need for a successful Kubernetes implementation with:

- multi-factor enterprise security,
- backup, and disaster recovery,
- centralized multi-cluster logging and monitoring, and
- automated configuration management.

Unlike other commercial Kubernetes solutions, Kublr lets you run on any operating system, use the development tools and environment of your dev team's choosing, and easily configure clusters where your ops team prefers.

Dev How You Want.
Run Where You Want.

Key Features

A Single Solution for All Your Environments -

Simplify the setup of production clusters with a cloud and infrastructure agnostic solution that you can deploy in minutes, out-of-the-box. Portable cluster deployment allows you to setup, run and manage Kubernetes in any environment, public and private clouds, across clouds, on-premise, and hybrid.

Enterprise-Grade, Production-Ready -

Benefit from the fully-automated features you need (built-in security, high availability and self-healing, auto-scaling, backup and disaster recovery, monitoring and logging, cloud provider integrations, support for VMs and bare metal), without the configuration hassles.

360-Degree Enterprise Security -

From secure communication between nodes to integrated identity management and image validation, Kublr secures your Kubernetes deployment.

Intelligent Operations -

Remove the complexity of Kubernetes management through automated deployment of logging and monitoring every time you create a cluster. For multi-cluster environments a unique centralized logging and monitoring capability places less overhead on your nodes. At-a-glance performance views from the Kublr Control Plane and built-in alerting enables IT to ensure system availability and application performance.

Open Platform -

Built on open technologies and standards with portable components (Elasticsearch, MongoDB, and more), Kublr is designed to be future compatible and not to lock you in.
